Overview

- 1 Introduction
- 2 Interference Characterization
- 3 Interference Estimation
- 4 Simulations & Results
- 5 Conclusions
- 6 Future Work

Wireless Mesh Networks (WMNs)

A Promising Technology

- Potential for widespread application.
 - Low-cost availability of IEEE 802.11 hardware.
 - Ease of scalability and reconfigurability.
 - Tremendous increase in data communication rates guaranteed by IEEE 802.11 and IEEE 802.16 standards.
- Wireless technologies that benefit from WMN deployments.
 - IEEE 802.11 WLANs, Wireless Metropolitan Area Networks (WMANs), Cellular mobile systems including LTE-Advanced etc.

WMN Model Considered

- A single Gateway WMN.
- Mesh-routers and mesh-clients.
- Multi-Radio Multi-Channel (MRMC) Deployment.
- Only inter mesh-router communication issues considered.

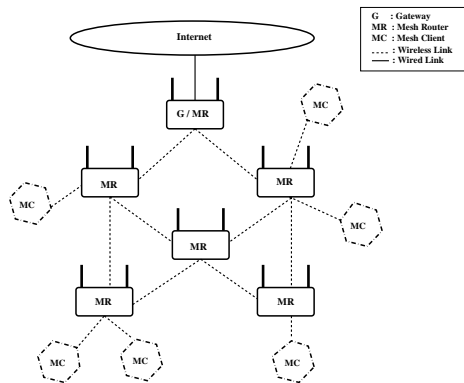

Figure: A Simplistic WMN Architecture

Concepts and Terminology I

Let $G = (V, E)$ represent an arbitrary WMN.

$V \rightarrow$ Set of nodes in G , $E \rightarrow$ Set of wireless links.

Let $i \in V, j \in V$, such that $(i, j) \in E$.

Conflict Links

- $\forall (m, n) \in E$, for which the transmitting range of the radio at node m or n , extends upto, or beyond node i or j , are the conflict links of link (i, j) .

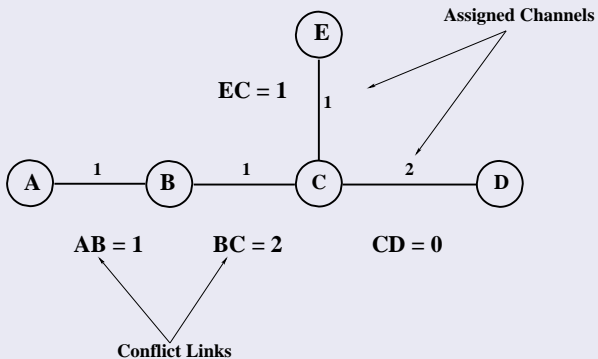

Interference Degree

- The Interference Degree of link (i, j) , is the total number of links in E which are the conflict links of (i, j) .

Concepts and Terminology II

An Illustration

Interference Degree of Links

Concepts and Terminology III

Total Interference Degree or TID

- An approximate estimate of the interference prevalent in a WMN.
- Computed by halving the summation of the *Interference Degree* of all the links in G .

Channel Assignment (CA) Scheme

- CA can be understood as, $C_i = CA(i, R_i)$, where
 - Each node i , has random number of identical radios R_i .
 - $C_i \Rightarrow$ List of channels assigned to R_i .
- Assumption : Number of available channels $> (R_i)_{max}$

Role of CA schemes in WMNs

- Interference → Most debilitating factor in network performance.
- Minimizing interference in WMNs is a primary objective.
- Mainly achieved through a prudent channel assignment (CA) scheme, which
 - Enhances network capacity.
 - Reduces end to end latency.
 - Reduces data packet loss.

Selecting the Right CA scheme for a WMN

- Multitude of CA schemes in research literature.
- Choosing an efficient CA for a WMN → A tedious task.
- Absence of CA performance prediction techniques.
- TID → Conventional approach of estimating interference.
 - Considers spatial proximity of links for interference estimation.
 - Not a reliable metric.

TID : A Reliable Metric ?

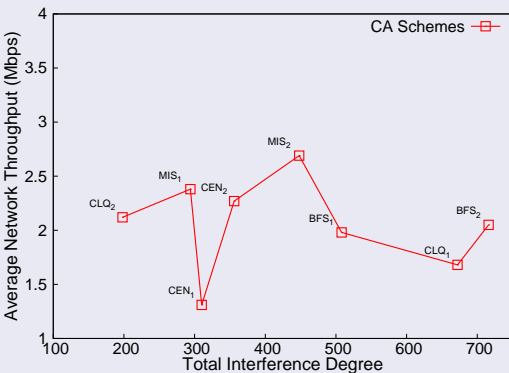

Expected Correlation Between Metrics & TID

- With increase in TID values
 - Network Throughput should decrease.
 - Loss in data packets should increase.

TID : A Reliable Metric ?

Observed Correlation Between Throughput & TID

● A result from our previous study [2].

- Labels denote the CA schemes used.
- Aggregate network throughput of CAs plotted against TID values.

TID : A Reliable Metric ?

Observed Correlation Between PLR & TID

● A result from our previous study [2].

- Labels denote the CA schemes used.
- Average Packet Loss Ratio of CAs plotted against TID values.

TID : A Reliable Metric ?

Conclusions

OBSERVED CORRELATION \nleftrightarrow EXPECTED CORRELATION

- TID → Not a reliable metric for interference estimation.
→ Not suited to predict CA performance in a WMN.

Fresh Characterization of Interference in WMNs

- We propose a fresh characterization of interference.
- We consider interference to be a three dimensional entity.
- The three dimensions are
 - Temporal
 - Spatial
 - Statistical
- We employ this model for interference estimation.

The Three Dimensions of Interference

Temporal Characteristics

- Data transmissions in Wireless network → Not synchronized
→ Random.
- Interference complexities → Function of time
→ Fundamentally temporal.

Spatial Characteristics

- Link Conflicts → Spatial proximity && Identical channel.
- Spatial interaction of wireless links → Interference in WMNs.

The Three Dimensions of Interference

Statistical Characteristics

- Channel assignment to radios → Complexity of interference.
- Even distribution of channels among radios → Fewer wireless conflicts.

Statistical Interference Estimation

Motivation

Factors Contributing To Idea Development

- TID is not a reliable metric.
- Statistical distribution of channels is linked to CA performance.

Proposed Approach

- **Channel Distribution Across Links** (CDAL) Approach.
- Determines distribution of channels across links.
- Computes $CDAL_{cost} \rightarrow$ Interference estimate.

Features of CDAL Approach

Probabilistic Selection of Links

- Transmission link selection is dynamic/temporal.
 - Happens at the MAC layer.
 - Predicting link selected for a transmission is difficult.
- Multiple links exist between two nodes.
 - Each link is considered equally likely to be selected.

An Example

(i) Network Topology

(ii) Available Communication Channels

- A & C can communicate on Channel₁ or Channel₂.
- CDAL considers both links equally likely.

CDAL Algorithm

INPUT : $G = (V, E)$ { WMN GRAPH }

CA { RADIOS AND CHANNELS }

CS { AVAILABLE CHANNEL SET }

FIND ALL LINKS PRESENT IN THE WMN

FIND CHANNEL ASSIGNED TO EACH LINK

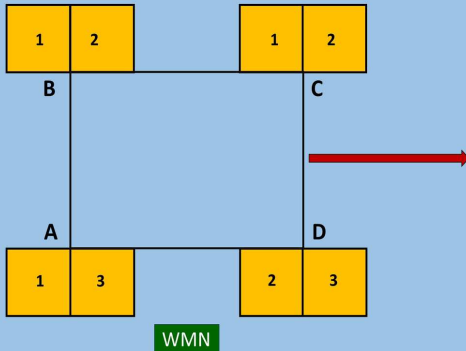

FIND LINK-COUNT L_i : NUMBER OF LINKS ACTIVE ON CHANNEL i

(LINK SELECTION IS EQUIPROBABLE)

FIND STANDARD DEVIATION (SD) OF CHANNEL LINK COUNTS WITH MEAN
 $= (\sum_i \text{LINK-COUNT}_i) / \text{NUMBER OF CHANNELS}$ $\text{CDAL}_{\text{cost}} = \text{SD}$ **OUTPUT :** $\text{CDAL}_{\text{cost}}$

CDAL Algorithm : A Theoretical Illustration

Sample WMN 1

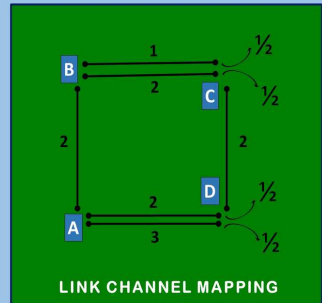

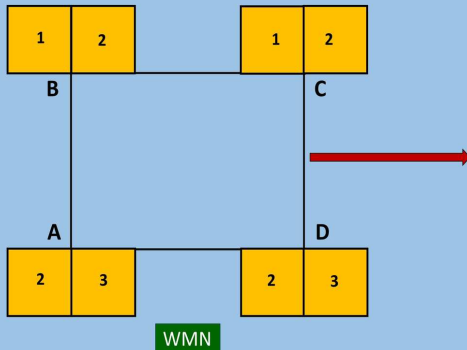

$$Ch_1 : Ch_2 : Ch_3 \rightarrow 1.5 : 1.5 : 1$$

$$CDAL_{COST} = 0.2357$$

CDAL Algorithm : A Theoretical Illustration

Sample WMN 2

$$\text{Ch}_1 : \text{Ch}_2 : \text{Ch}_3 \rightarrow 0.5 : 3 : 0.5$$

$$\text{CDAL}_{\text{COST}} = 1.1785$$

Choice of CA Schemes

CA Schemes Considered

- BFS-CA [3] → Breadth First Search based CA.
- MaIS-CA [5] → Maximum Independent Set based CA.
- CLQ-CA [1] → Maximum Clique based CA.
- CEN-CA [4] → Centralized Static CA
- GSCA → Grid Specific CA (Minimum TID).

CA Scheme Representation

- E-MMCG and C-MMCG [2] versions of each CA (except GSCA)
 - C-MMCG CA → CA_C , E-MMCG CA → CA_E .
- Representation of CAs
 - BFS-CA (BFS_C & BFS_E), MaIS-CA (MIS_C & MIS_E).
 - CEN-CA (CEN_C & CEN_E), CLQ-CA (CLQ_C & CLQ_E).
 - GSCA (GSCA).

Test Scenarios & Evaluation Procedure

Test Scenarios

Test Scenarios

- WMN layout → 5×5 Grid WMN

Grid WMN Test Cases

- 1 TC5 → 5 concurrent 4-Hop flows.
- 2 TC8 → 8 concurrent 4-Hop flows.
- 3 TC10 → 10 concurrent 4-Hop flows.
- 4 TC12 → 12 concurrent flows.
(4-Hop & 8-Hop)

Grid WMN Layout

Test Scenarios & Evaluation Procedure

Performance Metrics

Observed Network Performance Metrics

- Performance metrics for each test-case
 - Network Throughput.
 - Packet Loss Ratio.
- For every performance metric → Average of all test-cases.
- Performance metrics for each CA
 - Average Network Throughput (Throughput).
 - Average Packet Loss Ratio (PLR).

Test Scenarios & Evaluation Procedure

Simulation Parameters

ns-3 Simulation Parameters

Parameter	Value
Radios/Node	2
Range Of Radios	250 mts
IEEE Standard	802.11g
Available Orthogonal Channels	3 (2.4 GHz)
Transmitted File Size	10 MB
Maximum 802.11g/n Phy Datarate	54 Mbps
Maximum Segment Size (TCP)	1 KB
Packet Size (UDP)	1 KB
MAC Fragmentation Threshold	2200 Bytes
RTS/CTS	Enabled
Packet Interval (UDP)	50ms
Routing Protocol Used	OLSR
Loss Model	Range Propagation
Rate Control	Constant Rate

Test Scenarios & Evaluation Procedure

Evaluation Procedure

CA Sequences From Performance Metrics

- For every performance metric
 - CAs are arranged in increasing order of metric values.

CA Sequences From Theoretical Estimates

- TID and $CDAL_{cost}$ are computed for each CA.
- CAs arranged in increasing order of **expected performance**.
 - CA Performance $\propto 1 /$ (TID or $CDAL_{cost}$ value).
- Increasing order of expected performance \rightarrow
Decreasing order of TID/ $CDAL_{cost}$ values.

Test Scenarios & Evaluation Procedure

Evaluation Procedure

Error In Sequence (EIS) Computation

- Sequence of n CAs $\rightarrow {}^n C_2$ comparisons.
- CA sequences from experimental metrics \rightarrow Reference.
- In CA sequences from theoretical estimates
 - CA comparisons in error are determined.
 - Prediction by estimation metric contrary to actual performance.
- Sum of all CA comparison errors \rightarrow EIS.

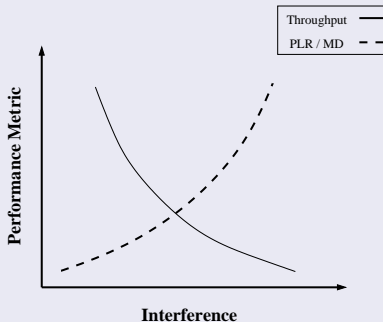

Degree of Confidence (DoC)

- DoC of estimation metric \rightarrow Reliability of CA performance prediction.
- $DoC = (1 - (EIS/{}^n C_2)) \times 100$
 - n is the number of CAs in the sequence.

Test Scenarios & Evaluation Procedure

Evaluation Procedure

Expected Correlation Between Metrics & TID

- Plot recorded CA performance metrics against theoretical estimates.
- Observe the plots for expected correlation.
- Determine DoC for interference estimate accuracy.

CDAL_{cost} : Performance Evaluation

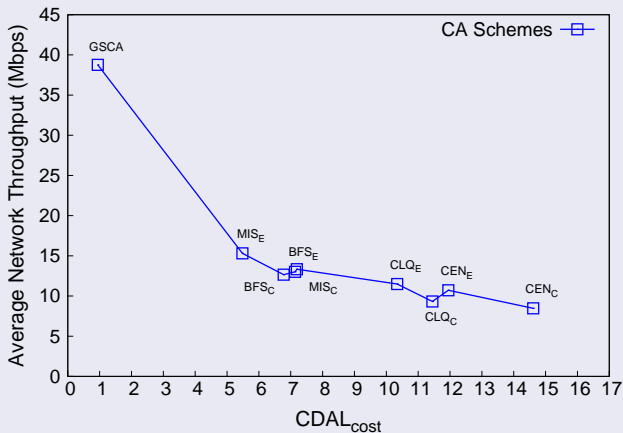

Avg Throughput vs TID Estimates

- Throughput does not decrease consistently with increase in TID.

CDAL_{cost} : Performance Evaluation

Avg Throughput vs CDAL_{cost}

- More consistent decrease in Throughput with increase in CDAL_{cost}.

CDAL_{cost} : Performance Evaluation

Avg PLR vs TID Estimates

- High deviation from expected correlation.

CDAL_{cost} : Performance Evaluation

Avg PLR vs CDAL_{cost}

- Lesser deviation from expected correlation.

Reliability of $CDAL_{cost}$

Degree of Confidence

Performance Metric	TID		$CDAL_{cost}$	
	EIS	DoC (%)	EIS	DoC (%)
Avg Throughput	15	58.33	4	88.89
Avg PLR	12	66.67	7	80.55

Conclusions

CDAL_{cost} Interference Estimation

- Reliable prediction of CA performance.
- More accurate than TID.
- Lesser computational cost $O(n^2m^2)$ than TID $O(n^2m^3)$.
 - $n \rightarrow$ Number of nodes in the WMN.
 - $m \rightarrow$ Number of radios on each node.

Future Work

- Verify accuracy of $CDAL_{cost}$ in other WMN layouts.
- Devise a better metric than $CDAL_{cost}$ through.
 - Spatio-statistical accounting of interference.
 - Link-quality based interference estimation.
- Use $CDAL_{cost}$ as an optimizing function in CA schemes.
